Overview

Threat Assessment, currently referred to as Threat Intelligence, is an embedded security reporting and alerting capabilities introduced with HP FutureSmart 5.10.0.7 for supported HP Enterprise devices referenced below.

Threat Assessment builds on HP's embedded security architecture by using device-generated security events, administrative change indicators, and network behavior observations to provide actionable guidance without requiring the customer to deploy or manage a dedicated SIEM tool for initial device-level review.

The implementation is device-centric and is intended to help reduce malware dwell time, improve incident response readiness, and provide administrators with meaningful security context for supported HP Enterprise printers and MFPs running the required firmware level.

In HP FutureSmart 5.10.0.7, Threat Assessment focuses on individual device reporting through the HP Embedded Web Server. Future releases will support broader fleet deployment in upcoming announcements.

System requirements

- HP FutureSmart firmware version 5.10.0.7 or newer.
- Supported HP Enterprise device platform using the Linux-based, HP FutureSmart 5 architecture.
- Administrator access to the HP Embedded Web Server (EWS) for configuration, review, and reporting.
- Valid device network configuration and email notification settings if administrator email alerts are used.

Limitations

The initial Threat Assessment implementation is limited to supported Enterprise devices and does not provide a multi-vendor fleet security operations platform. Reports and notifications are intended to supplement, not replace, the customer's existing security monitoring, incident response, and compliance processes.

NOTE: Threat Assessment identifies security-relevant signals and provides guidance for review. It does not independently confirm that malware is present, determine legal breach status, or replace customer forensic investigation procedures.

- Availability varies by product platform, firmware level, and supported device capability.
- Initial reporting is device-centric through EWS and exported reports.
- Fleet-level analytics and expanded integrations may require future releases or separate HP management tools.

- Customer-specific SIEM integration, escalation workflow, and response procedures remain the responsibility of the customer security organization.

Enable Threat Assessment via the EWS

Administrators should use Threat Assessment as part of a structured security review process. The following guidance describes the typical workflow for enabling, reviewing, and acting on device-level threat information.

Enabling Threat Assessment via the EWS

1. Upgrade the supported device to HP FutureSmart 5.10.0.7 or later if not completed.
2. Sign in to the HP Embedded Web Server using administrator credentials.
3. Review the Threat Assessment information for prioritized security events, configuration changes, and recommended guidance.
4. Configure administrator email notifications for designated security or print administrators to receive device-level alerts using the following instructions: https://support.hp.com/us-en/document/ish_4628911-908235-16
 - a. Select all Show Alerts to display Security Alerts.

Security Alerts

Alert Name	Threshold
☐ Password Brute Force Attempt	
☐ Firmware Integrity Check Failure	
☐ Security-Sensitive Configuration Change	
☐ Runtime Intrusion Detection	
☐ Suspicious Login	
☐ Network Behavior Anomaly Detection	

5. Navigate to the Security Tab and open Threat Assessment (currently labeled Threat Intelligence) within the left pane. From this page, you can export a .csv file of all security related syslog messages or export your filtered report (filter by time period, severity level, threat type, etc).

The screenshot shows the HP Embedded Web Server interface with the 'Security' tab selected. The left sidebar contains a navigation menu with 'Threat Intelligence' highlighted. The main content area is titled 'Threat Intelligence' and includes a 'Help' button. Below the title, there is a descriptive paragraph about the feature and a link to 'Alerts'. A section titled 'Retrieve Threat Intelligence Security Event Log' contains an 'Export' button. Below this, a 'Threat Intelligence Report' section allows users to set filters for 'When', 'Threat Type', and 'Severity'. The 'When' filter is set to 'All available'. The 'Threat Type' filter has 'Select All' checked. The 'Severity' filter has 'Select All' checked. At the bottom, there are 'View' and 'Export' buttons.

Threat Intelligence Help

The Threat Intelligence feature empowers printer administrators by providing visibility into security events, threats, and anomalies that might affect their printing infrastructure. Use this feature to quickly identify suspicious activities and detect potential vulnerabilities. Event guidance helps you respond effectively to security incidents.
Go to [Alerts](#) to configure email notifications for security-related alerts.

Retrieve Threat Intelligence Security Event Log

Export the Threat Intelligence log data to a file that can be used for detailed problem analysis. Click "Export" to generate the file.

Export

Threat Intelligence Report

Set filter, then click "View". Then export .csv file, if desired.

More Information

Threat Assessment should be positioned as an HP embedded device security visibility feature that helps customers identify, prioritize, and respond to security-relevant device conditions. It is most effective when combined with established print security best practices, firmware lifecycle management, administrator access controls, secure network configuration, and regular review of device logs and reports.

Call to action

After upgrade, administrators should review Threat Assessment reporting, configure notifications as needed, and incorporate exported results into existing security operations and incident response workflows.
